

Online Feedback Exchange

Summary: Online feedback exchange was an HCI research project I worked on as a sophomore, exploring different tools to support greater understanding of feedback in creative design processes. In this project, my workstyle with my graduate student mentor was to read a weekly paper about the effectiveness of grouping of styling text for more efficient interpretation, and then deliberate over its fit and possible implementation in our application. Our project was on a web application, and my work was implementing the full-stack application to allow designers to upload and manage their design projects, as well as to upload new iterations of those designs. I also deployed a separate design submission form on heroku while we were building the web application to allow designers to submit their design iterations as well as their feedback specifications.
